## Particle and Nuclear Physics at the MeV scale in Australia

Thursday, 13 April 2023 14:40 (20 minutes)

Recently, the ATOMKI group found evidence for a new fundamental boson, named the X17, observed via  $p+7\text{Li}\rightarrow 8\text{Be} + (\text{X17}\rightarrow(e+e-))$ ,  $p+3\text{H}\rightarrow 4\text{He} + (\text{X17}\rightarrow(e+e-))$  and  $p+311\text{B4} + (\text{X17}\rightarrow(e+e-))$  reactions with a mass of 17 MeV and significance  $> 7$ . There are now numerous projects to search for weakly coupled bosons, including the X17, using particle physics experiments. However, only the ATOMKI group have utilized nuclear reactions in a competitive way to date.

We intended to employ the Pelletron accelerator in Melbourne to initiate nuclear reactions of the kind:  $p+ZX\rightarrow Z+1Y + (e+e-)$  and to build a low mass, high precision Time Projection Chamber, (TPC) with world-first capabilities. The invariant mass resolution of the TPC to the  $(e+e-)$  final state is expected to be 0.1 MeV. This provides a substantially more sensitive search for anomalous  $(e+e-)$  production than any other experiment and 200 times more sensitivity than ATOMKI. Accordingly, we will either observe the ATOMKI anomaly on the Pelletron or exclude it at very high significance. Following this we propose a program to search for anomalous  $(e+e-)$  production with world-leading sensitivity in the 5-25 MeV mass region. In addition, the very large acceptance, and excellent angular and energy resolution of the TPC enables qualitatively more sensitive investigations of Nuclear Internal Pair Conversion decays. This capability enables a range of novel Nuclear Physics investigations.

The presentation will describe the proposed TPC, its expected performance together with its application and anticipated impact in particle and nuclear physics investigations.

### Speaker's Title

Prof.

### Speaker's Gender

Man

### Speaker's Preferred name (if any)

Martin

### Speaker's Pronouns

He/Him

### Speaker's Name

Martin Sevier

Primary authors: Prof. SEVIOR, Martin (University of Melbourne); Dr BIGNELL, Lindsey (Australian National University); Dr CURCEANU, Catalina (INFN (LNF)); Prof. KIBEDI, Tibor (Australian National University); Prof. JAMIESON, David (University of Melbourne); Prof. STUCHBERY, Andrew (Australian National University); Ms THAMM, Andrea (University of Melbourne); Prof. WHITE, Martin (University of Adelaide)

Presenter: Prof. SEVIOR, Martin (University of Melbourne)

Session Classification: Room 1 (Laby Theatre)

Track Classification: WG2: Detector technology development
