Controlling size and chirality of supramolecular cage complexes

A series of chiral coordination cage complexes has been synthesised using amino acid substituted diimide ligands. Using a biphenylsulfonediimide core (BPSD) substituted with amino acids, a series of quadruple stranded Cu₄L₄ cages have been formed. The cages contain two copper paddle-wheel units connected by four ligands. Analogous chiral complexes (helicates) and achiral complexes (mesocates) can be formed by controlling or removing the stereocentres within the ligands(1). Enantiopure leucine-substituted ligands (LeuBPSD) form helicates, complexes which have supramolecular chirality due to a twist in the ligands. Swapping the handedness of the amino acid ligand forms the opposite handedness helicate cage complex. The helicate cages are self-selecting, as the reaction of the (R,R) and (S,S) ligands with Cu(II) forms a mixture of enantiopure cages, with no product containing both ligands. Removing the chirality of the ligand, by using a BPSD ligand substituted with achiral amino acid, glycine (GlyBPSD), or using the (S,R)-LeuBPSD ligand, leads to the formation of mesocates, which lack supramolecular chirality. The cage complexes formed with BPSD ligands have an internal void volume of ~300 Å³. The use of alternative diimide amino acid substituted ligands have also been shown to form larger and more complex chiral supramolecular cages, which have an internal void volume of up to 1000 Å³, establishing the possibility of chiral catalysis and separation applications for these complexes.

Keywords or phrases (comma separated)

Chiral, supramolecular, cage, helicate, crystallography

Are you a student?

Yes

Do you wish to take part in the Student Poster Slam?

No

Are you an ECR? (<5 yrs since PhD/Masters)

No

What is your gender?

Female

Primary author: Ms BOER, Stephanie (Monash University)

Co-author: Dr TURNER, David (Monash University)

Presenter: Ms BOER, Stephanie (Monash University)

Track Classification: Advanced Materials
