Rare Earth Corrosion Inhibitors using 4-(4'-Methylphenyl)-4-oxo-butanoic acid

Rare earth 4-(4'-methylphenyl)-4-oxo-butanoate, (L) complexes $[\text{RE}(\text{L})_3(\text{H}_2\text{O})]$ (RE = Y, La, Ce, Nd, Ho, Er) have been prepared by metathesis reactions between the corresponding rare earth chloride and NaL to assess the potentiality as new corrosion inhibitors. The products were analysed by IR- and NMR-spectroscopy, elemental- and metal analysis and TGA measurements. The single crystal X-ray diffraction studies of $[\text{RE}(\text{L})_3(\text{H}_2\text{O})]$ (RE = Ce, Nd) and $[\text{Ce}(\text{L})_3(\text{dmsO})]$ revealed a 1D carboxylate bridged polymeric structure in the solid state, featuring nine coordinate rare earth ions. Upon comparison with x-ray powder diffraction patterns of the bulk materials, all of the $[\text{RE}(\text{L})_3(\text{H}_2\text{O})]$ complexes with the exception of RE = La are isomorphous, implying that no fundamental structural changes were detected from RE = Ce to RE = Er despite the lanthanoid contraction.

Are you a student?

Yes

Do you wish to take part in the Student Poster Slam?

No

Are you an ECR? (<5 yrs since PhD/Masters)

No

What is your gender?

Male

Primary author: Mr HEILMANN, Oliver (Monash University)

Co-authors: Mr DE BRUIN-DICKASON, Caspar (Monash University); Prof. DEACON, Glen (Monash University)

Presenter: Mr HEILMANN, Oliver (Monash University)

Track Classification: Advanced Materials
