European Spallation Source Progress and Status

Wednesday, 14 November 2018 16:00 (5 minutes)

The European Spallation Source has commenced operation of the ion source, the first accelerator component. Construction, equipment delivery, control system development, and commissioning of the subsequent accelerator sections and the target is ongoing. In parallel, in-kind partners are designing, building, and commissioning a number of experimental instruments that are expected to be ready for operation when neutrons are available.

A suite of EPICS services will be used at ESS, including CS-Studio, ChannelFinder, BEAST, Archive Appliance, and MASAR.

ESS is involved with ongoing EPICS developments, including EPICS 7 and CS-Studio. A new EPICS build system is being developed to simplify EPICS IOC development and deployment.
